

Soil Structure

The Importance of soil composition and moisture

Illustrative Soil Horizons

- Organic, O Horizon

- Surface, A Horizon

- The depth of each horizon varies significantly between soil types and within a soil type**

- Adapted from:
https://en.wikipedia.org/wiki/Soil_horizon - Feb2021,
by Larry D King

Horizons

O (Organic) 0-2 in.

A (Surface) 2-10 in.

B (Subsoil) 10-36 in.

C (Substratum) 36-60 in.

R (Bedrock) 60+ in.

The Living Soil

Soil Components

- Soil may be simply described by its three primary component's
 - mineral matter (sand, silt, & clay),
 - Air, and
 - Water
- The relative percentages of these three components vary greatly with soils
- Organic Matter significantly influences Soil Structure which impacts both air and water percentages

Soil Components – Silty Loam

- Mineral Components – Silty Loam
 - Sand – 14%
 - Silt – 69%
 - Clay – 17%
- The partitioning of these three components can vary greatly among different silty loam soils
- Organic matter improves soil structure

Combined Impacts: Increasing Soil Structure with Organic Matter

Soil Characteristic	Organic Matter				Change from 1.4 to 4%
	1.4%	2%	3%	4%	
Wilting Point	11.5%	11.8%	12.3%	12.8%	11.3 %
Field Capacity	31.5%	32.0%	33.1%	34.1%	8.3 %
Available Water, in/ft	2.39	2.42	2.49	2.56	7.1 %
Saturation	45.2%	46.9%	50.4%	53.9%	19.2 %
Saturated Hydraulic Conductivity, in/hr	0.33	0.42	0.63	0.89	169.7 %
Bulk Density, lb/ft ³	90.62	87.82	82.04	76.23	(15.9)%
